

Your Technical Interview Guide

Welcome to your preparation guide for interview at Docusign! Use the table of contents below to quickly jump to the section you are looking for.

Whether you're preparing for your initial phone screen or your full loop interview, we have put together this guide to help you know what to expect and how to prepare. We know interviewing can be nerve-wracking, so we hope this guide provides the information and resources you need.

Remember, your recruiter is there to support you, so please reach out to them with any questions.

What you'll find in this guide:

Accommodations process.....	1
Interview process overview.....	1
Coding & Problem Solving Interview.....	2
Design Interview.....	3
Hiring Manager Interview.....	4
Post interview – What to expect.....	4

Accommodation Process

Docusign is committed to providing reasonable accommodations for qualified individuals with disabilities in our job application procedures. If you need such an accommodation, or a religious accommodation, during the application process, please contact us at accommodations@docusign.com If you experience any issues, concerns, or technical difficulties during the application process please get in touch with our Talent organization at taops@docusign.com for assistance.

Important: Academic Integrity

We want to see how you approach problems on your own. For this reason, we ask that you do not use any outside assistance during your interviews. This includes, but is not limited to, consulting external resources, seeking help from others, or using AI tools like ChatGPT/cluely etc.If you are having trouble understanding a question, it is completely fine to ask your interviewer to speak more slowly or clarify.

What will your interview process be?

During your interview process, you can expect a full-loop round with three to five technical discussions (depending on the level you are being considered). Each interview(60 min) is designed to give you a few minutes at the end to ask your own questions.

These interviews will cover the following areas:

- **Coding & Problem-Solving:** To assess your technical skills & gauge your analytical thinking and ability to break down complex issues.
- **System Design:** To evaluate your ability to create and scale technical systems.
- **Hiring Manager:** This final interview is with the hiring manager and will cover both your behavioral attributes and technical skills.

Before we start our conversation, to ensure a smooth interview experience, please take a moment to prepare.

- **Find a quiet space**
- **Check your equipment:** You'll need a laptop with a webcam, speakers, and a microphone.
- **Prepare for video calls:** Please ensure screen sharing is enabled in advance, as it may take a few minutes to set up. You can find guidance on how to do this [here](#)
- **Avoid visual filters:** For your interview, turn your video camera on and disable any visual filters, including virtual or blurred backgrounds. This helps us focus on your problem-solving process
- You will be using HackerRank to work through coding problems during your interviews

Coding & Problem Solving interview

At Docusign, we use many different coding languages, so it's best to practice in the one you're most comfortable with. Choose a language you know well rather than trying to learn a new one. You should plan to solve a complete problem(maximum two) in **roughly 50 minutes**. Once you have a solution, take a moment to review it. Make sure it's correct, handles edge cases, is efficient, and clearly reflects your logic.

The technical interview will assess your coding skills and problem-solving approach. Your code's structure, style, and efficiency are just as important as the final solution. It's okay to make minor errors; identifying and fixing bugs during the interview is a plus. In a coding interview, the interviewer will evaluate you on four key areas:

- **Communication:** Engage with the interviewer by asking clarifying questions before you start coding
- **Problem-Solving:** Explain your thought process, compare different approaches, and discuss how you'd optimize your solution's time and space complexity
- **Coding:** Write clean, well-structured code that translates your solution
- **Verification:** Test your own code and explain why you believe it's correct, or walk through it to find and fix any bugs

Tips for Preparation

- **Algorithms and Data Structures:** Review common algorithms and data structures, including arrays, stacks, queues, hash tables, trees, graphs, and heaps. Also don't miss time/space complexity. Practising medium level difficulty questions from leetcode would help navigate through the coding interview
- **Problem-Solving:** Before coding, fully understand the problem by asking questions and breaking it down
- **Simplify:** If a solution seems too complex, look for a simpler approach. Writing things out can help you find bugs and new insights
- **Practice with the Right Tools:** Use a basic text editor to simulate the interview environment. Practice vocalizing your thought process as you explore solutions

System Design Interview

This interview assesses your ability to solve a complex engineering design problem. Your 60-minute interview will be a deeply technical discussion on system or product architectural design, depending on the role.

Confirm the interview type with your recruiter if you're unsure.

During the System Design Interview

In this interview, we expect you to demonstrate an understanding of how low-level constraints affect high-level goals. Some key areas to discuss during this interview are:

- Testability
- Usability
- Extensibility
- Security
- Availability
- Scalability
- Observability & traceability

Example System Design Questions:

- Design a URL shortener
- Build a Facebook chat
- Architect a worldwide video distribution system

During the Product Architecture or Design Interview

This interview focuses on building a product or API that can operate at a large scale to support an end-user service.

Areas to be familiar with:

- Storage data models
- SOLID principles
- Scalability
- Design patterns
- Protocols
- Data formats

Example Product Architecture Questions:

- Design a service or product API
- Design a chat service or a feed API
- Design an email server

Tips for Preparation

- **Start with Requirements:** When presented with a broad question, start by asking clarifying questions to define the scope. For example, if asked to design a messaging system's front end, you might ask:
 - How many users are we designing for?
 - What kind of features do we need to support?
 - What are the latency requirements?
 - How will we handle error states?
 - Which approach to choose between Synchronous VS Asynchronous?
- **Focus on Trade-offs:** Avoid getting fixated on only the most optimal solutions. We are more interested in seeing how you think through the pros and cons of different approaches

Hiring Manager Interview

This is a 60-minute session where your interviewer wants to get to know you better. They'll ask about your background, what you're passionate about in technology, and the kind of impact you want to make.

Your interviewer will be looking at how your skills and experience could help Docusign. They'll also want to see how you handle new and unfamiliar challenges. In this interview, you will be assessed on five key areas:

- **Resolving Conflict:** Your interviewer will be looking for how you resolve conflicts and if you can empathize with different points of view
- **Continuous Growth:** We want to see your desire to learn and grow. Do you view constructive criticism as a chance to improve your skills?
- **Embracing Ambiguity:** How do you operate in a fast-paced, changing environment? Are you comfortable making decisions and staying productive even when you don't have all the information?
- **Driving Results:** Your interviewer will assess your ability to push yourself and others to achieve goals.
- **Effective Communication:** How well do you communicate with your teams and with partners from other departments? We'll be looking at how you adapt your communication style based on the project and the audience

Tips for Preparation

- **Know Your Story:** Take time to review your resume. Your interviewer will likely ask about key moments in your career, so be ready to discuss 2-3 major projects in depth.
- **Use the STAR Method**:** To keep your answers clear and organized, try using the STAR method to structure your thoughts. It's a simple, effective way to tell a complete story.
- **Use Concrete Examples:** Always support your answers with real-life experiences. Avoid giving theoretical responses; your interviewer will ask for a specific example to ground the conversation.

Post interview-What to expect

Your recruiter will provide a specific timeline and updates throughout the process. They will let you know about the next steps as soon as a decision is made after your interview. If you haven't heard back within a week, feel free to follow up with them directly.
